RICE BALL SEMINAR

Use of Generative AI for Research

Use Of Sci Space In Targeted Literature Search

The workshop outlines a proposed approach to using SciSpace, an artificial intelligence platform, fortargeted literature searching and the development of focused literature reviews. The approach begins witha clearly defined research question, followed by structured prompts specifying the topic, population,context, and evidence required. Retrieved studies will be screened against predefined eligibility criteria, while summaries and data extraction will support comparison of study objectives, methods, findings, andlimitations. Relevant evidence will then be organised into thematic sections to inform a coherent narrativesynthesis and identify research gaps. Researcher oversight will include checking original publications, verifying citations, and assessing whether generated summaries accurately reflect the underlying evidence. Attention will be given to relevance, incomplete retrieval, and unsupported interpretations. This workflow aims to support efficient literature exploration and focused synthesis while retaining critical appraisal andscholarly judgement. Its usefulness should be evaluated through retrieval relevance, synthesis accuracy, andresearcher time requirements.
